

Sand Trap

The Sand Trap is a unique way to separate and settle out sand, shale and oxidized organics found in some water supplies. We are able to do this by running the water through an internal swirl chamber then into a diverting plate. This will allow the heavier particles to settle to the bottom of the tank for blow down.

- No moving parts
- No filter cartridges to clean or replace
- No back washing needed
- Up to 75 G.P.M
- No electric required
- Up to 1 1/2" inlet & outlet
- 5 year warranty on tank and head assembly

For worry-free operation, install the Auto Flush Valve for an automatic daily blow-down of sediment.
