

Every Dairy Is Different.

Your water should be treated that way.

Whether you're evaluating water treatment for the first time...

Replacing aging equipment...

Or trying to solve an ongoing water quality issue...

Aquapproach can help

We start by understanding your water. Then we design a treatment program specifically for your operation.

No one-size-fits-all systems.
No guesswork.

Just practical solutions backed by experienced people.

The Cost of Poor Water Quality Isn't Always Obvious.

Until you measure it.

Let's evaluate your water and help you understand what's really happening between your well and your cows.

What Is Your Water Really Costing You?

A Guide to Better Dairy Water Management

The most important nutrient on your dairy may be the one receiving the least attention.

Water Is the Most Consumed Nutrient on Your Dairy.

Your cows consume water before they consume feed.

Every pound of milk begins with water.

Many dairies routinely test feed

- ✓ balance rations
- ✓ monitor milk production
- ✓ track reproduction

...while giving very little attention to the quality of the water their cows drink every day.

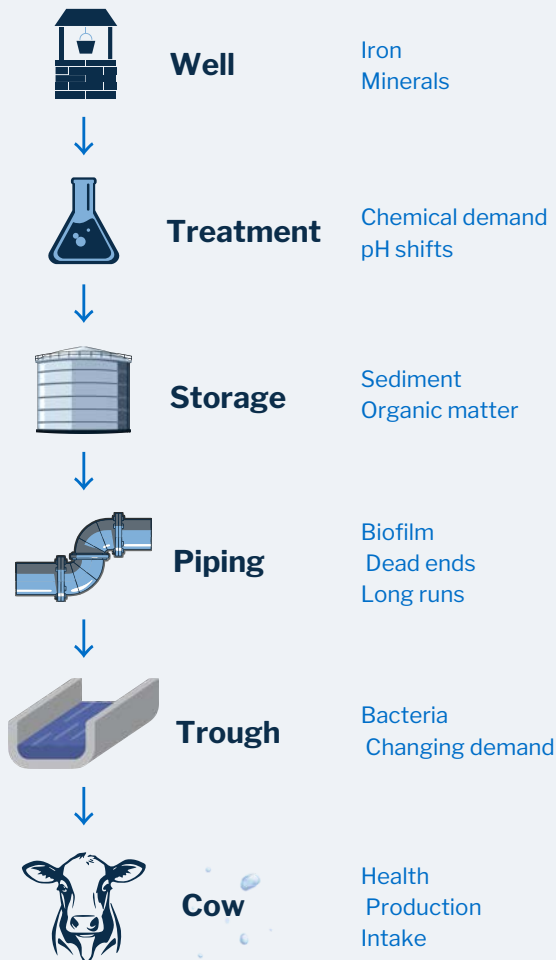

Doesn't your water system deserve the same level of management?

Five Questions Every Dairy Should Ask

1. Do you know the sanitizer residual at the end of your water lines?
2. Have your water lines ever been cleaned internally?
3. Could biofilm be reducing the effectiveness of your sanitizer?
4. Are your troughs receiving the same water quality as your treatment room?
5. How often is your water actually tested?

Water Changes Between the Well and the Cow.

Every step introduces variables.
Every variable affects your cows.

We Help Producers Take Control of Their Water.

Aquapproach provides complete water treatment programs designed specifically for dairy operations.

Equipment • Chemistry • Monitoring
Testing • Support • Training

Imagine Knowing...

Imagine knowing your sanitizer levels before arriving at the farm.

Imagine receiving an alert before treatment stops.

Imagine reducing manual testing.

Imagine seeing trends before they become problems.

Imagine having one company responsible for your entire program.

Because successful water treatment isn't about installing equipment.

It's about consistently delivering clean water to every cow.
